## 1-5 Returning Merchandise for Service

A receipt or copy of your invoice marked with the date of purchase is required before any warranty service will be rendered. You can obtain service by calling your vendor for a Returned Merchandise Authorization (RMA) number. When returning to the manufacturer, the RMA number should be prominently displayed on the outside of the shipping carton, and mailed prepaid or hand-carried. Shipping and handling charges will be applied for all orders that must be mailed when service is complete.

For faster service, RMA authorizations may be requested online (<http://www.supermicro.com/support/rma/>).

Whenever possible, repack the chassis in the original Supermicro carton, using the original packaging material. If these are no longer available, be sure to pack the chassis securely, using packaging material to surround the chassis so that it does not shift within the carton and become damaged during shipping.

This warranty only covers normal consumer use and does not cover damages incurred in shipping or from failure due to the alteration, misuse, abuse or improper maintenance of products.

During the warranty period, contact your distributor first for any product problems.

## Chapter 4

# System Interface

### 4-1 Overview

There are several LEDs on the control panel and on the drive carriers that provide system and component status. This chapter explains the meanings of all LED indicators and the appropriate responses that need to be taken.

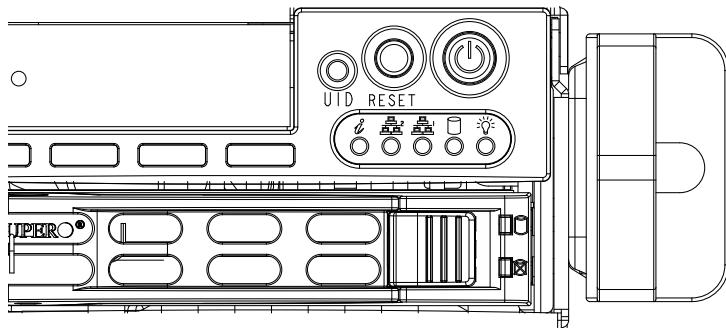

Figure 4-1: Control Panel Buttons and LEDs

## 4-2 Control Panel Buttons

The SC113 chassis includes two or three push-buttons located on the front panel:  
A reset button, a power on/off button, and a UID button

- Reset: The reset button is used to reboot the system.

- Power: The main power switch is used to apply or remove power from the power supply to the server system. Turning off system power with this button removes the main power but keeps standby power supplied to the system. Except for hot-swappable components which do not require for the system to be powered-down, disconnect the chassis from any power source prior to performing maintenance on the chassis.

- UID: When used with a UID-compatible motherboard, the UID button is used to turn on or off the blue light function of the the U-LED. Once the blue light is activated, the unit can be easily located in very large racks and server banks.

## 4-3 Control Panel LEDs

The control panel located on the front of the SC113 chassis has five LEDs. They provide critical information related to different parts of the system. This section explains what each LED indicates when illuminated and any action that may be required.

- **Information LED:** Alerts operator of several states, as noted in the table below.

Informational LED	
Status	Description
Continuously on and red	An overheat condition has occurred. (This may be caused by cable congestion.)
Blinking red (1Hz)	Fan failure, check for an inoperative fan.
Blinking red (0.25Hz)	Power failure, check for a non-operational power supply.
Solid blue	Local UID has been activated. Use this function to locate the server in a rack mount environment.
Blinking blue (300 mSEC)	Remote UID is on. Use this function to identify the server from a remote location.

- NIC2: Indicates network activity on GLAN2 when flashing.

- NIC1: Indicates network activity on GLAN1 when flashing.

- HDD: Indicates IDE channel activity. SAS/SATA drive and/or DVD-ROM drive activity when flashing.

- Power: Indicates power is being supplied to the system's power supply units. This LED should normally be illuminated when the system is operating.

## 4-4 Drive Carrier LEDs

The SC113 chassis uses SAS/SATA drives.

### SAS/SATA Drives

Each SAS/SATA drive carrier has two LEDs.

- Green: Each Serial ATA drive carrier has a green LED. When illuminated, this green LED (on the front of the SATA drive carrier) indicates drive activity. A connection to the SATA backplane enables this LED to blink on and off when that particular drive is being accessed.
- Red: The red LED indicates a SAS/SATA drive failure. If one of the SAS/SATA drives fail, you should be notified by your system management software.

## 4-5 Power Supply LEDs

This chassis provides several options which may include hot-swappable, cold-swappable, and redundant power supplies. Some power supplies include an LED in the rear with the following definitions:

### 560W, 650W and 700W Power Supplies

- Solid Green: When illuminated, the green LED indicates that the power supply is on.
- Solid Amber: When illuminated, the amber LED indicates the power supply is plugged in and turned off, or the system is off but in an abnormal state.

560W, 650W and 700W Power Supply LEDs	
State	Indication
Solid Green	System is on.
Solid Amber	System is off and plugged in or 5V stand by on.
Blinking Amber (Only for 650W)	Power supply internal temperature has reached 63° Celsius and will be shut down if the temperature reaches 70° Celsius.

## Chapter 5

### Chassis Setup and Maintenance

#### 5-1 Overview

This chapter covers the steps required to install components and perform maintenance on the chassis. The only tool required is a Phillips screwdriver.

Review the warnings and precautions listed in the manual before setting up or servicing this chassis. These include information in Chapter 2: System Safety and the warning/precautions listed in the setup instructions

#### 5-2 Removing the Power Cord

Before performing any setup or maintenance on the chassis, use the following procedure to ensure that power has been removed from the system.

1. Use the operating system to power down the node, following the on-screen prompts.
2. After the system has completely shut-down, carefully grasp the head of the power cord and gently pull it out of the back of the power supply. If your system has dual power supplies, remove the cords from both power supplies.
3. Disconnect the cord from the power strip or wall outlet.

## 5-3 Removing the Chassis Cover

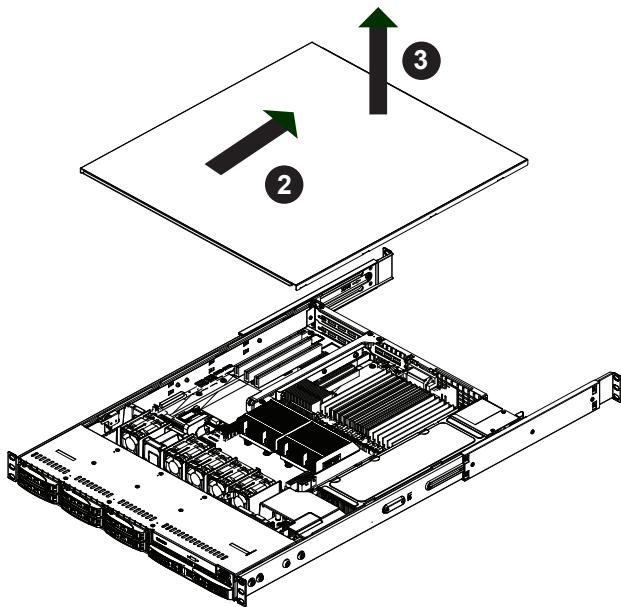

Figure 5-1: Removing the Chassis Cover

### ***Removing the Chassis Cover:***

1. Remove the screws securing the top cover to the chassis.
2. Slide the cover toward the rear of the chassis.
3. Lift the cover up and off of the chassis.

**Caution:** Except for short periods of time, do NOT operate the server without the cover in place. The chassis cover must be in place to allow proper airflow and prevent overheating.

## 5-4 Installing and Removing Hard Drives

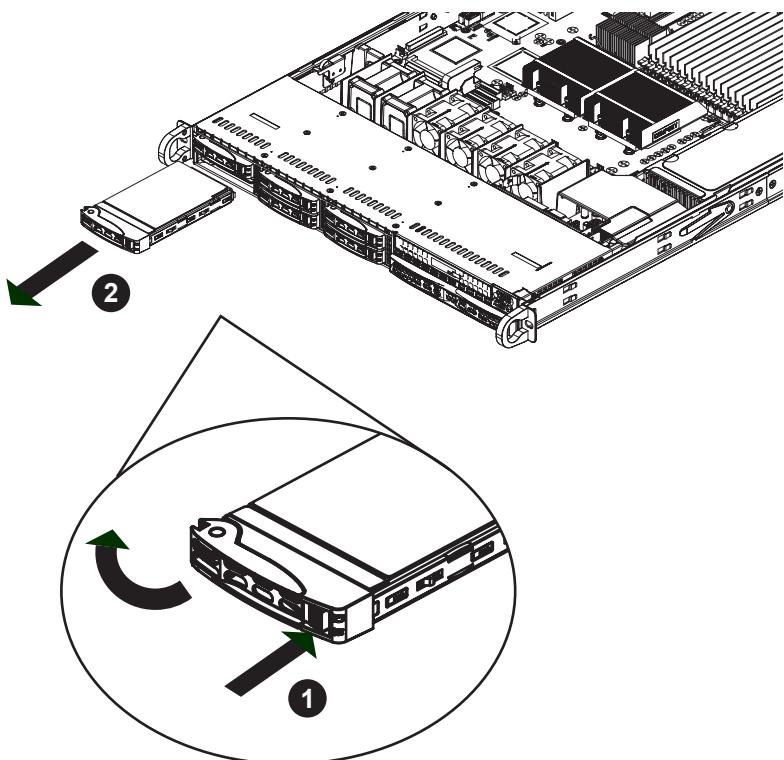

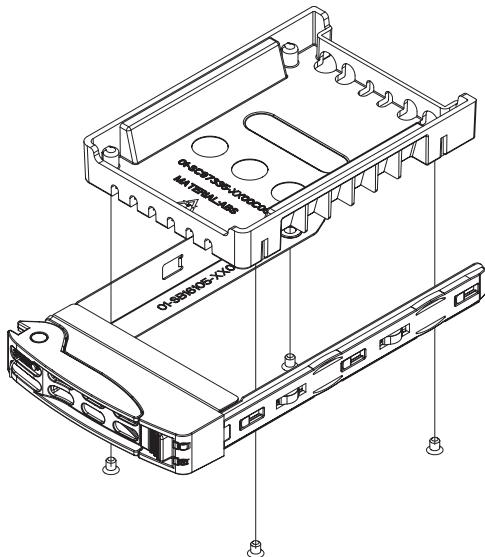

Figure 5-2: Removing Hard Drive

The SC113 chassis accepts eight hot-swappable hard drives. Only SAS or enterprise SATA HDDs are recommended.

### ***Removing Hard Drive Carriers from the Chassis***

1. Press the release button on the drive carrier. This extends the drive carrier handle.
2. Use the handle to pull the drive out of the chassis.

Note that only enterprise level HDDs are recommended for use in the SC113 chassis.

**Figure 5-3: Removing the Dummy Drive from the Hard Drive Carrier**

***Installing a Hard Drive into a Drive Carrier***

1. Remove the dummy drive, which comes pre-installed in the drive carrier, by removing the screws securing the dummy drive to the carrier. Note that these screws cannot be reused on the actual 2.5" hard drive.
2. Insert a drive into the carrier with the PCB side facing down and the connector end toward the rear of the carrier.
3. Align the drive in the carrier so that the screw holes of both line up. Note that there are holes in the carrier marked "SATA" to aid in the correct positioning.
4. Secure the drive to the carrier with four M3 screws. These screws are included in the chassis accessory box.
5. Insert the drive carrier into its bay, keeping the carrier oriented so that the hard drive is on the top of the carrier and the release button is on the right side. When the carrier reaches the rear of the bay, the release handle will retract.
6. Push the handle in until it clicks into its locked position.

**Caution:** Except for short periods of time (swapping hard drives), do not operate the server with the hard drives empty.

## 5-5 DVD-ROM Drive Installation

The SC113 chassis models include a DVD-ROM, which is usually pre-installed.

### *Installing or Replacing a DVD-ROM Drive*

1. Power down the system as described in Section 5-2 and if necessary, remove the server from the rack and pull the mini-bezel (grate) from the DVD-ROM drive bay.
2. Remove the chassis cover.
3. Unplug the drives power and data cables from the motherboard and/or backplane.
4. Unlock the mini-bezel lock screw and remove the mini-bezel from the drive bay. The bezel can be removed by pulling out the hard drive beneath the DVD-ROM, then pulling the mini-bezel forward.
5. When installing or removing a DVD-ROM drive, the mini-bezel lock screw must be removed and the drive tray must be completely separated from the chassis.
6. Remove the DVD-ROM from the drive tray by removing the drive screws, then secure the replacement DVD-ROM into the drive tray, using the drive screws.

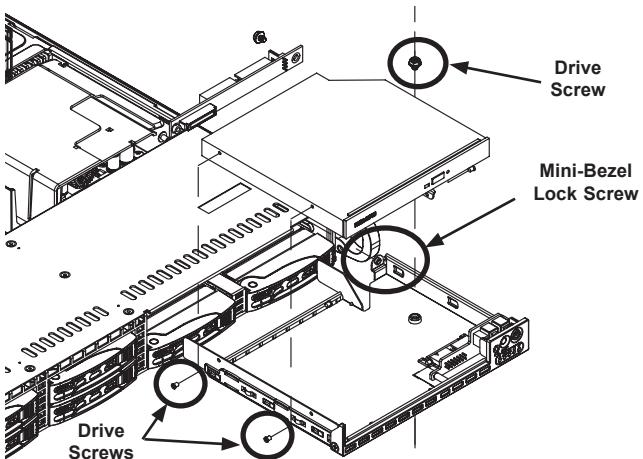

Figure 5-4: Installing the DVD-ROM Drive

7. Reattach the drive tray to the chassis by replacing the mini-bezel lock screw, and tightening it from inside the chassis.
8. Reconnect the data and power cables.
9. Replace the chassis cover (replace the server in the rack, if necessary) and power up the system.

## 5-6 Removing the Backplane

The SC113 chassis backplane is located behind the hard drives and in front of the front system fans. In order to change the jumper settings on the backplane, it may be necessary to remove the backplane from the chassis.

### *Removing the Backplane from the Chassis*

1. Power down the system as described in Section 5-2 and remover the cover..
2. Disconnect the cabling to the backplane.
3. Remove the five upper screws at the top of the backplane, indicated by the arrows below.
4. Lift the backplane up and out of the chassis.

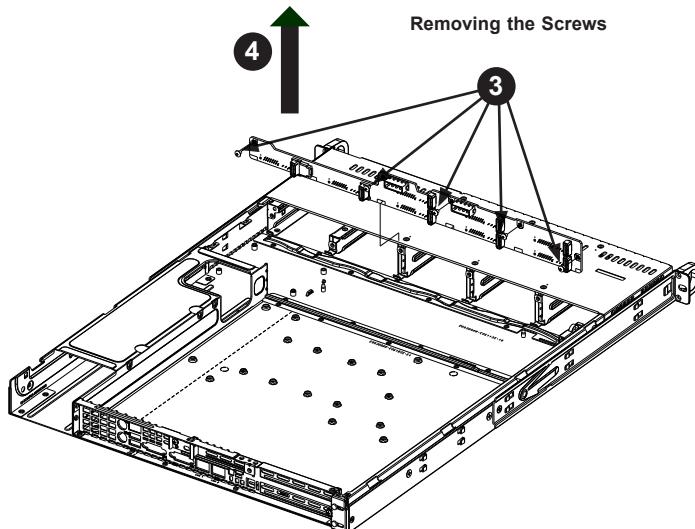

Figure 5-5: Removing the Backplane

## 5-7 Backplane Installation

### *Installing the Backplane*

1. Slide the backplane into the chassis as shown, inserting the lower edge of the backplane into the clips on the floor of the chassis.
2. Align the mounting holes in the backplane with the mounting holes in the chassis
3. Secure the backplane to the chassis using the five screws provided with the backplane.
4. Connect the wiring to the backplane.

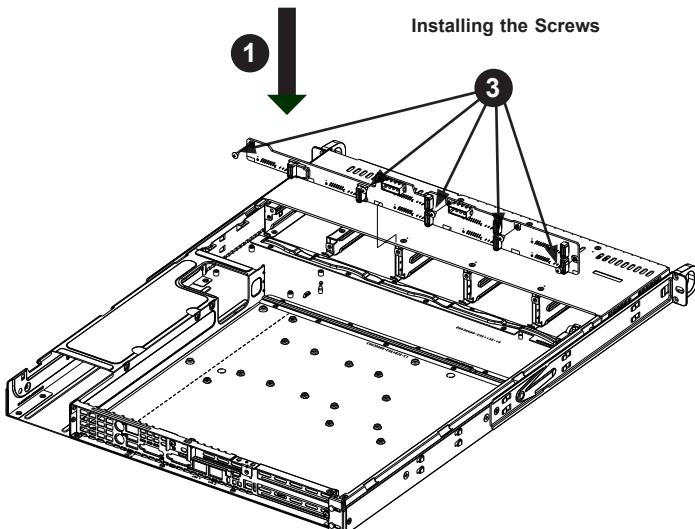

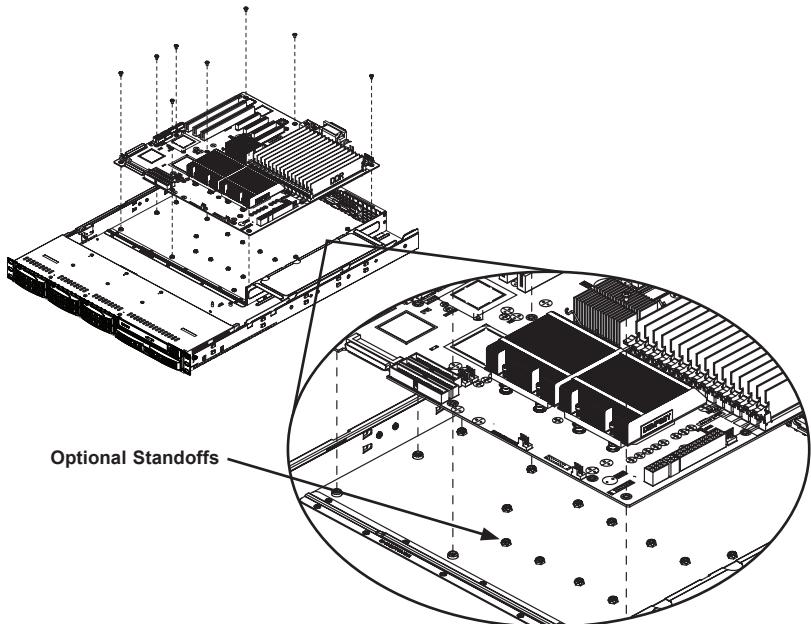

Figure 5-6: Installing the Backplane

## 5-8 Installing the Motherboard

**Figure 5-7: Chassis Standoffs**

### Permanent and Optional Standoffs

Standoffs prevent short circuits by creating space between the motherboard and the chassis surface. The SC113 chassis includes permanent standoffs in locations used by most motherboards. These standoffs accept the rounded Phillips head screws included in the SC113 accessories packaging.

Some motherboards require additional screws for heatsinks, general components and/or non-standard security. Optional standoffs are included for these motherboards.

To use an optional standoff, you must place the hexagonal screw through the bottom the chassis and secure the screw with the hexagon nut (rounded side up). Compare the holes in the motherboard to those in the chassis and add or remove standoffs as needed.

## Motherboard Installation

### *Installing the Motherboard*

1. Review the documentation that came with your motherboard. Become familiar with component placement, requirements, and precautions.
2. Power down the system as described in Section 5-2 and lay the chassis on a flat surface.
3. Open the chassis cover.
4. If necessary, remove the riser card. To do this, remove the two screws holding the card in place and lift the card from the chassis.
5. As required by your motherboard, install standoffs in any areas that do not have a permanent standoff. To do this:
  - A. Place a hexagonal standoff screw through the bottom the chassis.
  - B. Secure the screw with the hexagon nut (rounded side up).
6. Lay the motherboard on the chassis aligning the permanent and optional standoffs with the holes in the motherboard, adding or removing standoffs as needed.
7. Secure the motherboard to the chassis using the rounded, Phillips head screws. Do not exceed eight pounds of torque when tightening the motherboard.
8. Secure the CPU(s), heatsinks, and other components to the motherboard, chassis, and/or backplane as needed.

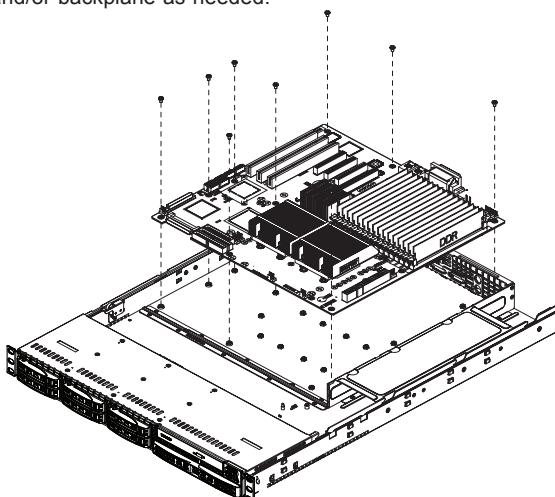

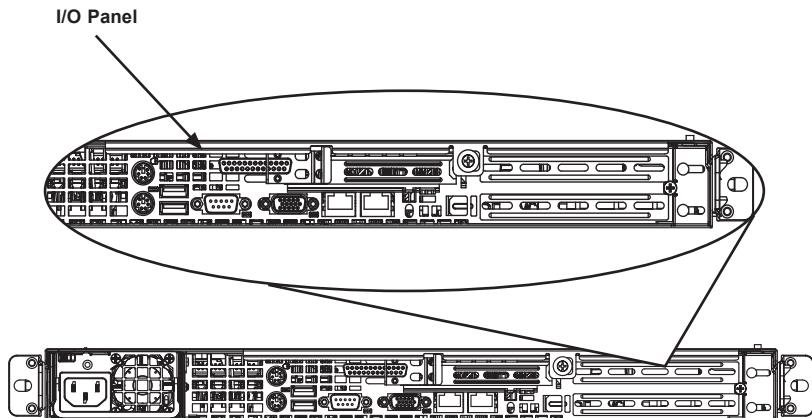

Figure 5-8: Securing the Motherboard to the Chassis

## Expansion Card Setup

The SC113 chassis includes I/O slots for add-on cards and expansion cards. "C" models (like SC113TQ-700CB) include one full height slot. "U" model chassis include two full-height expansion slots and one low-profile expansion slot.

**Note:** You must use a riser card to install expansion cards into any SC113 chassis. Riser cards are sold separately.

For the latest compatibility and performance information, visit our website at: <http://www.supermicro.com>.

**Figure 5-9: SC113 Chassis Rear  
with Two Full Height/Full Length PCI Slots  
and One Low Profile PCI Slot**

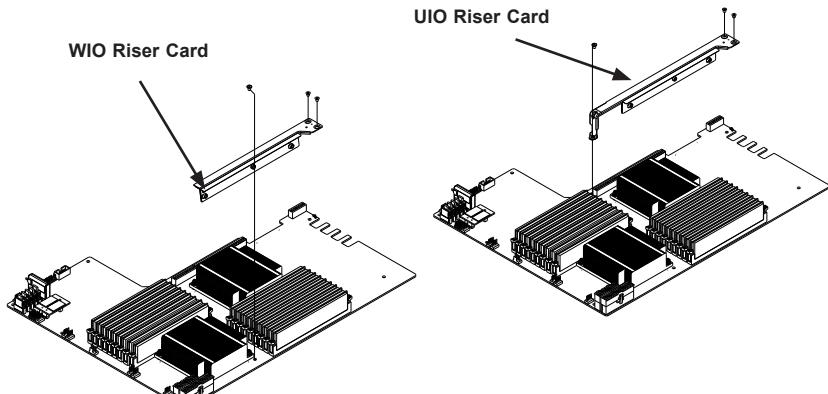

Figure 5-10: Chassis with a Riser Card

#### ***Installing an Expansion Card***

1. Confirm that you have the correct riser card for your chassis model and the add-on card includes a standard bracket.
2. Remove the chassis cover.
3. Install the riser card onto the bracket. Insert the card and bracket into the appropriate slot on the motherboard. Secure the riser bracket to the chassis using screws as illustrated.
4. Choose the PCI slot in which to place the add-on card.
5. In that slot, open the PCI slot panel lever and slide the PCI slot panel sideways.
6. From inside the chassis, remove the PCI slot panel panel.
7. Slide the add-on card into the riser card and attach the add-on card bracket in place of the PCI slot panel.
8. Secure the add-on card by closing the I/O panel lever.
9. Connect cables to the add-on card if necessary.

## 5-9 Installing the Air Shroud

Air shrouds concentrate airflow to maximize fan efficiency. The SC113 chassis air shroud does not require screws for installation.

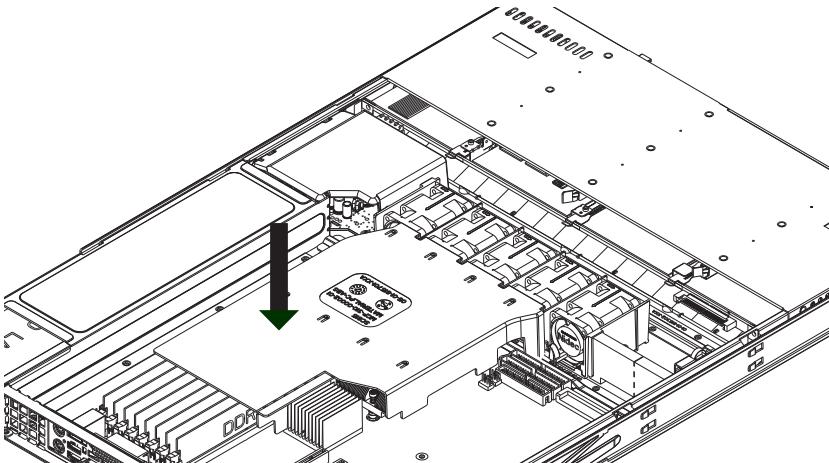

Figure 5-11: Air Shroud Installation

### ***Air Shroud Installation***

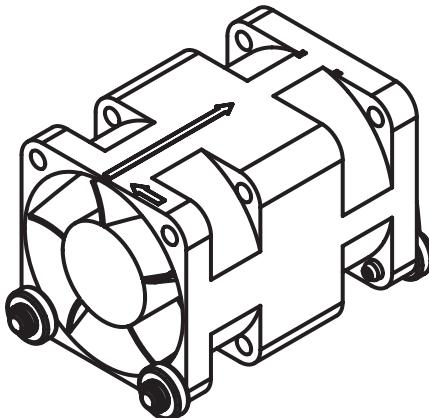

1. Align the air shroud with the CPU, memory card and fan locations.
2. Check the air shroud and serverboard components, removing the break-away piece from the side of the air shroud if required.
3. Place the air shroud into the chassis.

## Checking the Airflow

### *Check the Airflow*

1. Make sure there are no objects to obstruct airflow in and out of the server. In addition, if you are using a front bezel, make sure the bezel's filter is replaced periodically.
2. Do not operate the server without drives or drive trays in the drive bays. Use only recommended server parts.
3. Make sure no wires or foreign objects obstruct the airflow through the chassis. Pull all excess cabling out of the airflow path or use shorter cables.
4. The control panel LEDs inform you of system status. See “Chapter 3: System Interface” for details on the LEDs and the control panel buttons.

## 5-10 System Fans

**Figure 5-12: System Fan**

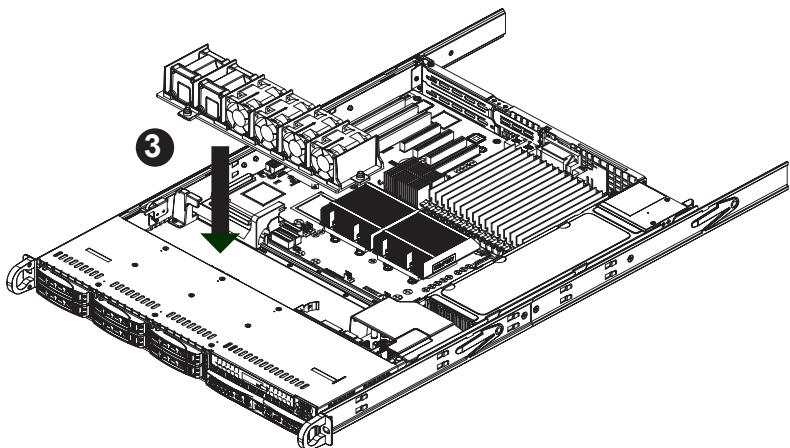

Four heavy-duty fans provide cooling for the chassis. These fans circulate air through the chassis as a means of lowering the chassis' internal temperature.

The SC113 chassis contains counter-rotating fans. Each fan unit is actually made up of two fans joined back-to-back, which rotate in opposite directions. This counter-rotating action generates exceptional airflow and works to dampen vibration levels.

The SC113 chassis provides two additional open fan housings, where additional system fans may be added for optimal cooling.

### ***Adding a System Fan***

1. Power down the system as described in Section 5-2.
2. Remove the screws securing the fan tray to the chassis.
3. Remove the dummy fan from the fan tray by pushing it up from the bottom.
4. Place the new fan into the vacant space in the housing while making sure the arrows on the top of the fan (indicating air direction) point in the same direction as the arrows on the other fans.
5. Secure the fan tray to the chassis using the screws removed previously.
6. Connect the fan wires to the fan headers on the serverboard.
7. Power-up the system and check that the fan is working properly before replacing the chassis cover.

**Figure 5-13: Chassis Fans**

The SC113 chassis includes four pre-installed fans. Two additional open slots are available so that up to two more fans may be added.

#### **Replacing a System Fan**

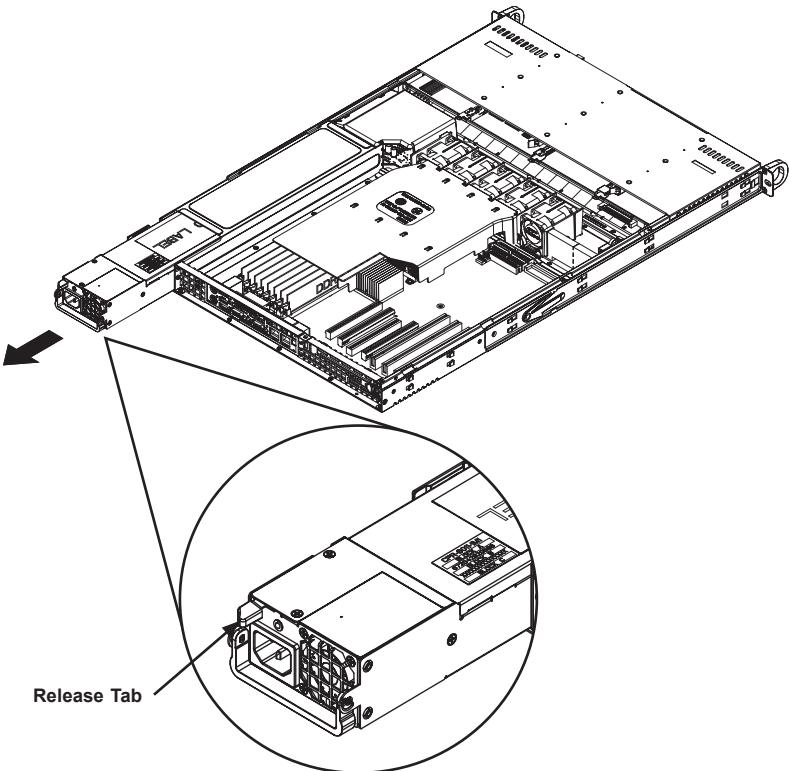

1. If necessary, open the chassis while the power is running to determine which fan has failed. Never run the server for an extended period of time with the chassis open.
2. Power down the system as described in Section 5-2.
3. Remove the failed fan's power cord from the serverboard.
4. Unscrew the fan tray from the chassis and push the failed fan from the up from the bottom of the tray.
5. Place the new fan into the vacant space in the housing while making sure the arrows on the top of the fan (indicating air direction) point in the same direction as the arrows on the other fans.
6. Reconnect the fan wires to the exact same chassis fan headers as the previous fan.
7. Power up the system and check that the fan is working properly before replacing the chassis cover.

## 5-11 Power Supply

Depending on your chassis model, the SC113 chassis has a 560W, 650W or 700W power supply. This power supply is auto-switching capable. They automatically sense and operate at a 100v to 240v input voltage. An amber light will be illuminated on the power supply when the power is off. An illuminated green light indicates that the power supply is operating.

### Power Supply Failure

If the power supply unit fails, the system will shut down and you will need to replace the unit. Replacement units can be ordered directly from Supermicro. (See the contact information in the Preface). Chassis models with only one power supply unit require that the power must be completely removed from the server before removing and replacing the power supply unit. "R" model chassis include a redundant power supply which may be exchanged without powering-down the server.

**Figure 5-14: Removing the Power Supply**

#### ***Replacing the Power Supply***

1. Power down the system as described in Section 5-2. If your chassis includes a redundant power supply (at least two power modules), you can leave the server running and remove only one power supply.
2. Push the release tab (on the back of the power supply) as illustrated.
3. Pull the power supply out using the handle provided.
4. Replace the failed power module with the same model.
5. Push the new power supply module into the power bay until you hear a click.
6. Plug the AC power cord back into the module and power up the server.

# Chapter 6

## Rack Installation

### 6-1 Overview

This chapter provides a quick setup checklist to get your chassis up and running. Following these steps in the order given should enable you to have the system operational within a minimum amount of time.

### 6-2 Unpacking the System

You should inspect the box the chassis was shipped in and note if it was damaged in any way. If the chassis itself shows damage you should file a damage claim with the carrier who delivered it.

Decide on a suitable location for the rack unit that will hold your chassis. It should be situated in a clean, dust-free area that is well ventilated. Avoid areas where heat, electrical noise and electromagnetic fields are generated. You will also need it placed near a grounded power outlet. Be sure to read the Rack and Server Pre-cautions in the next section.

### 6-3 Preparing for Setup

The box your chassis was shipped in should include two sets of rail assemblies, two rail mounting brackets and the mounting screws you will need to install the system into the rack. Please read this section in its entirety before you begin the installation procedure outlined in the sections that follow.

#### Choosing a Setup Location

- Leave enough clearance in front of the rack to enable you to open the front door completely (~25 inches).
- Leave approximately 30 inches of clearance in the back of the rack to allow for sufficient airflow and ease in servicing.
- This product is for installation only in a Restricted Access Location (dedicated equipment rooms, service closets and the like).

## Rack Precautions

- Ensure that the leveling jacks on the bottom of the rack are fully extended to the floor with the full weight of the rack resting on them.
- In single rack installation, stabilizers should be attached to the rack.
- In multiple rack installations, the racks should be coupled together.
- Always make sure the rack is stable before extending a component from the rack.
- You should extend only one component at a time - extending two or more simultaneously may cause the rack to become unstable.

## General Server Precautions

- Review the electrical and general safety precautions that came with the components you are adding to your chassis.
- Determine the placement of each component in the rack *before* you install the rails.
- Install the heaviest server components on the bottom of the rack first, and then work up.
- Use a regulating uninterruptible power supply (UPS) to protect the server from power surges, voltage spikes and to keep your system operating in case of a power failure.
- Allow the hot plug hard drives and power supply modules to cool before touching them.
- Always keep the rack's front door and all panels and components on the servers closed when not servicing to maintain proper cooling.

## Rack Mounting Considerations

### Ambient Operating Temperature

If installed in a closed or multi-unit rack assembly, the ambient operating temperature of the rack environment may be greater than the ambient temperature of the room. Therefore, consideration should be given to installing the equipment in an environment compatible with the manufacturer's maximum rated ambient temperature ( $T_{mra}$ ).

### Reduced Airflow

Equipment should be mounted into a rack so that the amount of airflow required for safe operation is not compromised.

### Mechanical Loading

Equipment should be mounted into a rack so that a hazardous condition does not arise due to uneven mechanical loading.

### Circuit Overloading

Consideration should be given to the connection of the equipment to the power supply circuitry and the effect that any possible overloading of circuits might have on overcurrent protection and power supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

### Reliable Ground

A reliable ground must be maintained at all times. To ensure this, the rack itself should be grounded. Particular attention should be given to power supply connections other than the direct connections to the branch circuit (i.e. the use of power strips, etc.).

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.

## 6-4 Rack Mounting Instructions

This section provides information on installing the SC113 chassis into a rack unit with the rails provided. There are a variety of rack units on the market, which may mean the assembly procedure will differ slightly. You should also refer to the installation instructions that came with the rack unit you are using.

**NOTE:** This rail will fit a rack between 26" and 33.5" deep.

### Identifying the Sections of the Rack Rails

The chassis package includes two rack rail assemblies in the rack mounting kit. Each assembly consists of two sections: an inner fixed chassis rail that secures directly to the server chassis and an outer fixed rack rail that secures directly to the rack itself.

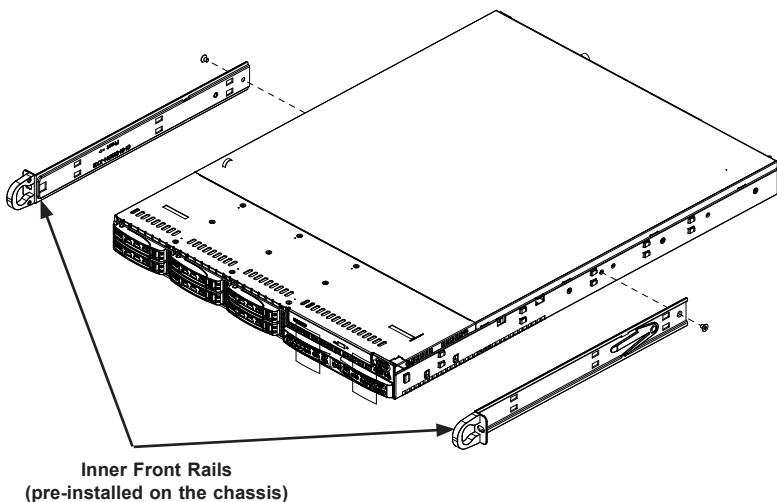

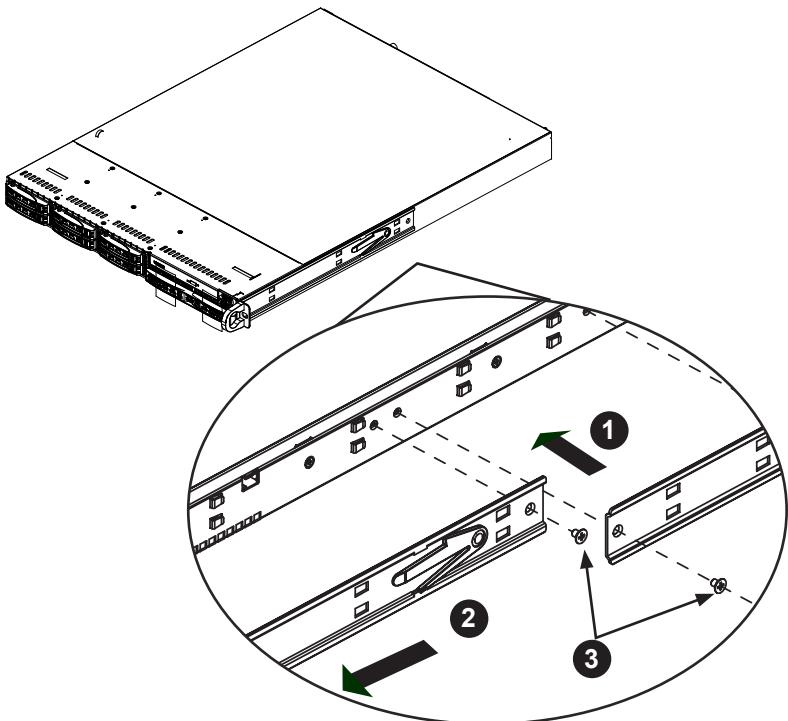

Figure 6-1: Identifying the Inner Front Rails

Warning: do not pick up the server by the front handles. They are designed to pull the system from a rack only.

**Figure 6-2: Identifying the Sections of the Rack Rails  
(right side rail shown)**

### Optional Inner Rail Extension

The SC113 chassis includes a set of inner rails in two sections: inner rails and optional inner rail extensions. The inner rails are pre-attached and do not interfere with normal use of the chassis if you decide not to use a server rack. Attach the inner rail extension to stabilize the chassis within the rack.

#### *Installing the Inner Rail Extentions*

1. Place the inner rail extensions on the side of the chassis aligning the hooks of the chassis with the rail extension holes. Make sure the extension faces "outward" just like the pre-attached inner rail.
2. Slide the extension toward the front of the chassis.
3. Secure the chassis with two screws as illustrated.
4. Repeat steps 1-3 for the other inner rail extension.

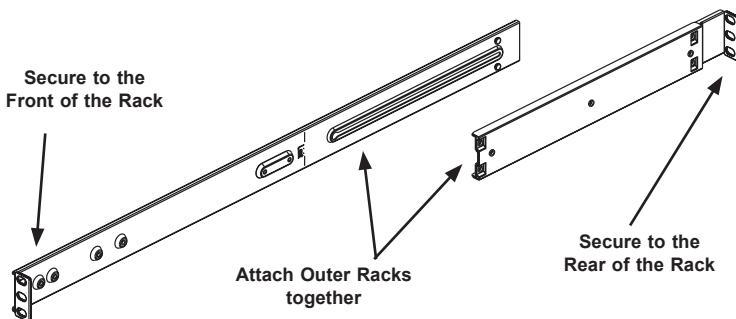

Figure 6-3: Assembling the Outer Rails

## Outer Rails

### *Installing the Outer Rails to the Rack*

1. Attach the shorter outer rail to the outside of the longer outer rail. You must align the pins with the slides. Also, both bracket ends must face the same direction.
2. Adjust both the shorter and longer brackets to the proper distance so that the rail fits snugly into the rack.
3. Secure the long bracket to the front side of the outer rail with two M5 screws and the short bracket to the rear side of the outer rail with three M5 screws.
4. Repeat steps 1-4 for the left outer rail.

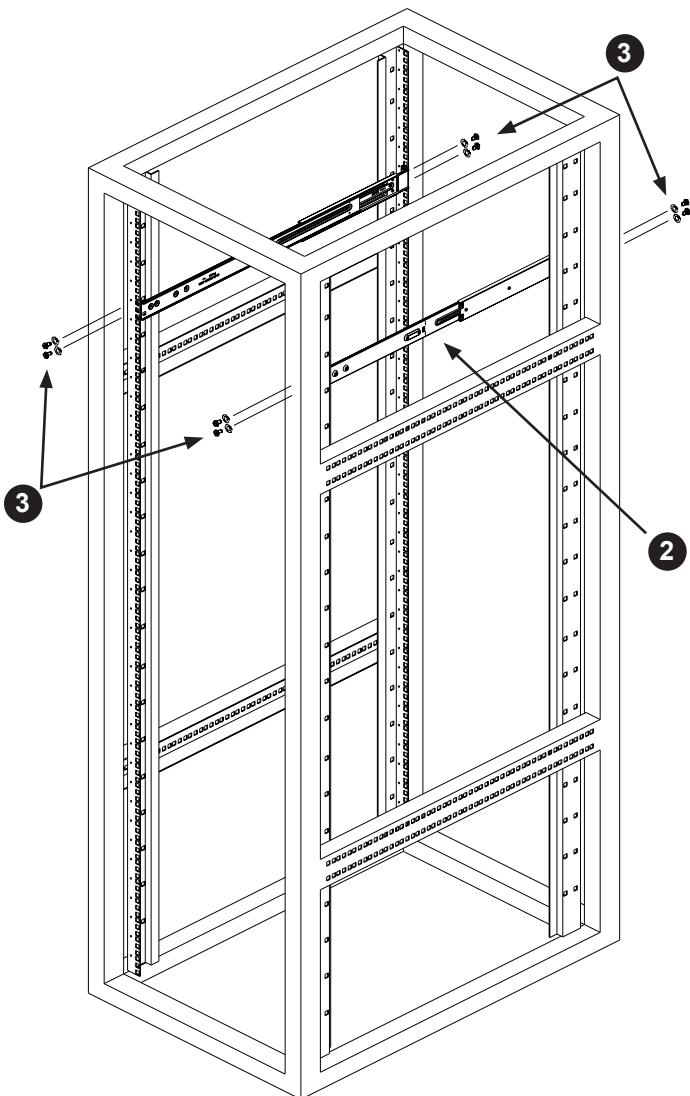

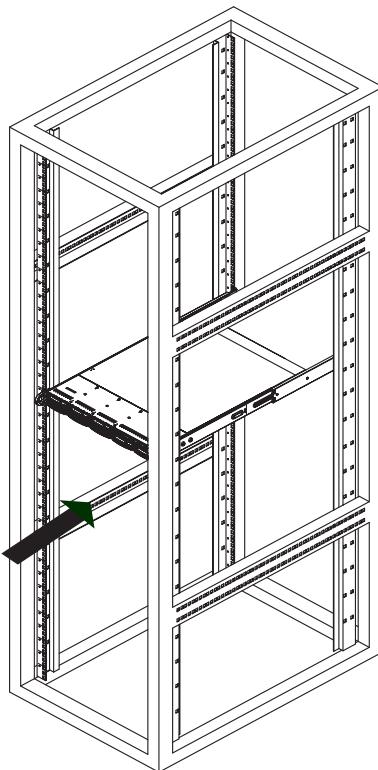

Figure 6-4: Installing the Outer Rails to the Server Rack

**Figure 6-5: Installing the Server into a Rack**

***Installing the Chassis into a Rack***

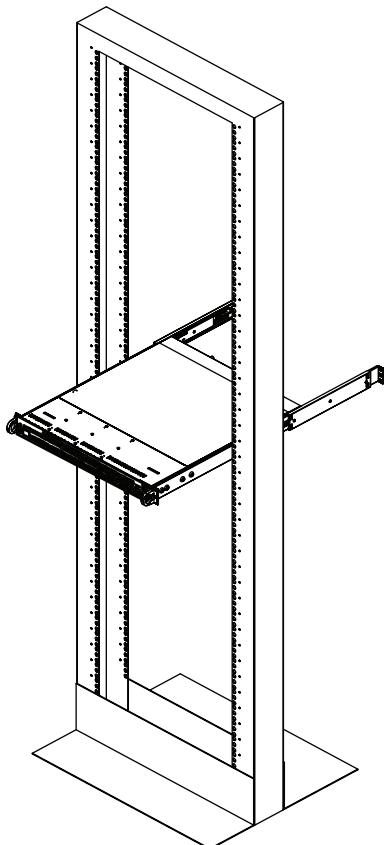

1. Confirm that chassis includes the inner rails and inner rail extensions. Also confirm that the outer rails are installed on the rack.
2. Align the chassis inner rails with the front of the out rails on the rack.
3. Slide the chassis rails into the rack rails, keeping the pressure even on both sides (you may have to depress the locking tabs when inserting). When the server has been pushed completely into the rack, you should hear the locking tabs click into position.
4. (Optional) Insert and tighten the thumbscrews which secure the front of the server to the rack.

Stability hazard. The rack stabilizing mechanism must be in place, or the rack must be bolted to the floor before you slide the unit out for servicing. Failure to stabilize the rack can cause the rack to tip over.

## Installing the Chassis into a Telco rack

To install the chassis into a Telco type rack, use two L-shaped brackets on either side of the chassis (four total). First, determine how far follow the server will extend out the front of the rack. Larger chassis should be positioned to balance the weight between front and back. If a bezel is included on your server, remove it. Then attach the two front brackets to each side of the chassis, then the two rear brackets positioned with just enough space to accommodate the width of the telco rack. Finish by sliding the chassis into the rack and tightening the brackets to the rack.

### BPN-SAS-113TQ Backplane

To avoid personal injury and property damage, carefully follow all the safety steps listed below when accessing your system or handling the components.

#### C-1 ESD Safety Guidelines

*Electrostatic Discharge (ESD) can damage electronic components. To prevent damage to your system, it is important to handle it very carefully. The following measures are generally sufficient to protect your equipment from ESD.*

- Use a grounded wrist strap designed to prevent static discharge.
- Touch a grounded metal object before removing a component from the antistatic bag.
- Handle the backplane by its edges only; do not touch its components, peripheral chips, memory modules or gold contacts.
- When handling chips or modules, avoid touching their pins.
- Put the backplane and peripherals back into their antistatic bags when not in use.

#### C-2 General Safety Guidelines

- Always disconnect power cables before installing or removing any components from the computer, including the SAS-113TQ backplane.
- Disconnect the power cable before installing or removing any cables from the backplane.
- Make sure that the SAS-113TQ backplane is securely and properly installed on the motherboard to prevent damage to the system due to power shortage.

### Explanation of Jumpers

To modify the operation of the backplane, jumpers can be used to choose between optional settings. Jumpers create shorts between two pins to change the function of the connector. Pin 1 is identified with a square solder pad on the printed circuit board. Note: On two pin jumpers, "Closed" means the jumper is on and "Open" means the jumper is off the pins.
